

CSS Flexible Box and Grid Layout

The web is fluid

The first website

Layouts in the dark ages (the 90s)

- Complex nested tables
- inline styles (such as they were)
- spacer gifs
- absolutely no flexibility
- animated gifs, marquee etc
- geocities

Table layouts

```
<table BGCOLOR="#ccccff" BORDER=10 BORDERCOLOR="#0000FF" BORDERCOLORLIGHT="#33CCFF" BORDERCOLORDARK="#0000CC" WIDTH="80%" ALIGN="CENTER">
  <tr>
    <td>
      <h1 align="center">
        <FONT SIZE="3" COLOR="red" FACE="verdana">
          Welcome to my home page!
        </FONT>
      </h1>
    </td>
  </tr>
</table>
```

Table-less layouts - divs, floats and positioning

- separation of presentation and content
- floats
- absolute and relative positioning
- media queries

Aww yeah, Bootstrap 4 is coming!

Currently v3.3.7

Flexbox versus grid

- flexbox was designed for layout in one dimension, i.e. layout in a row *or* a column

Flexbox - flex-direction: row

Flexbox - flex-direction: column

Flexbox versus grid

- Grid was designed for two-dimensional layout, i.e. layout in rows and columns at the same time

Grid

Flexbox

- The defining aspect of the flex layout is the ability to alter items' width and/or height to best fit in the available space on any display device.
- A flex container expands items to fill available free space, or shrinks them to prevent overflow.
- Display mode is direction agnostic

Flexbox diagram

Grid

CSS Grid Layout introduces a two dimensional grid system to CSS. Grids can be used to lay out major page area or small user interface elements.

What is a grid?

A grid is an intersecting set of horizontal and vertical lines – one set defining columns and the other rows. Onto the grid elements can be placed respecting these column and row lines.

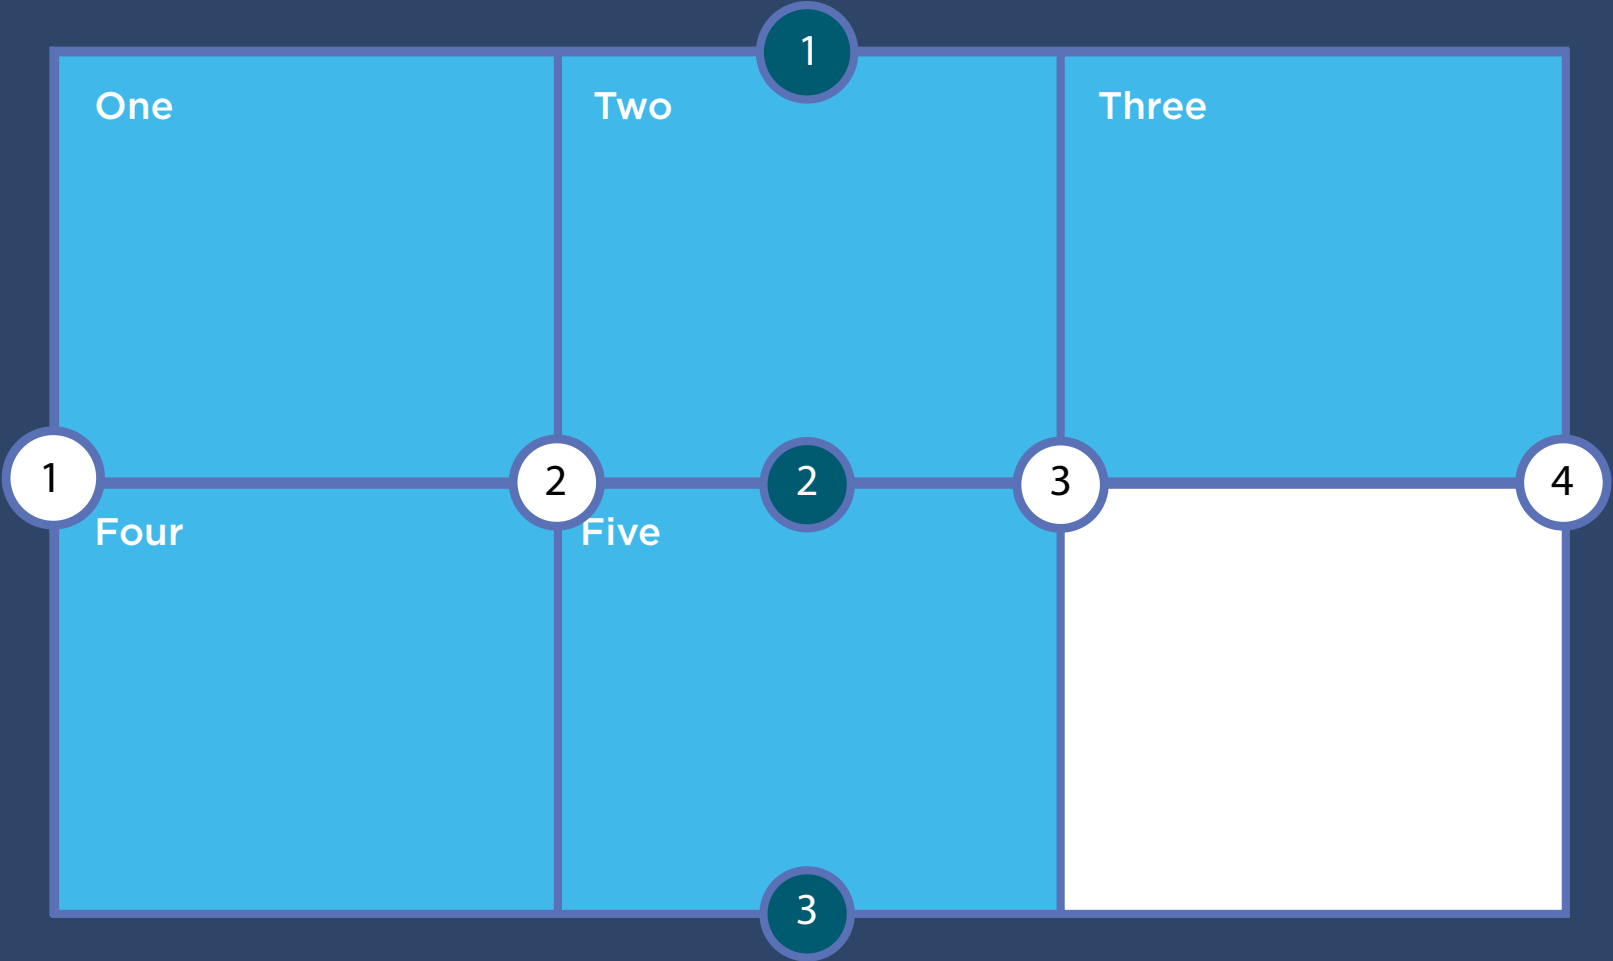

Features

- Fixed and flexible track sizes
- Item placement
- Creation of additional tracks to hold content
- Alignment control
- Control of overlapping content

The Grid container

We create a grid container by declaring `display: grid` or `display: inline-grid` on an element. As soon as we do this all direct children of that element will become grid items.

Grid

fr unit

- Fractional unit
- 1fr is for 1 part of the available space

Use other CSS features

- `content-fill: fit-content` etc

Browser support flexbox

#

Flexible Box Layout Module - CR

Method of positioning elements in horizontal or vertical stacks.
Support includes the support for the all properties prefixed with `flex` as well as `display: flex`, `display: inline-flex`, `align-content`, `align-items`, `align-self`, `justify-content` and `order`.

Global 83.12% + 14.49% = 97.61%
unprefixed: 82.2% + 3.66% = 85.86%

		54	59						

Notes Known issues (8) Resources (13) Feedback

Most partial support refers to supporting an **older version** of the specification or an **older syntax**.

⁴ Partial support is due to large amount of bugs present (see known issues)

Browser support grid

#

CSS Grid Layout - CR

Method of using a grid concept to lay out content, providing a mechanism for authors to divide available space for layout into columns and rows using a set of predictable sizing behaviors. Includes support for all `grid-*` properties and the `fr` unit.
